## BRIEF REVIEW

### Hydrometeorological conditions

During summer expedition wind ranged from 1 to 8 m/s. The height of the waves was observed 0,5 m. Air temperature varied from 16 to 24 °C and a relative humidity ranged from 47 to 91 %. Visibility was 15 - 20 km. During the expedition dominated 1-3 scores *Cumulus* clouds.

### Hydrological observations

**Water temperature.** Surface water temperature ranged from 17,4 °C (at Alksnynė) to 22,2 °C (in exclusive economic zone beside Palanga) during summer expedition in the Baltic Sea. Water temperature decreased with the depth and reached ~ 9 °C at the bottom water layer of deeper territorial sea oceanographic stations.

**Water salinity.** Surface water salinity ranged from 3,9 ‰ (at Klaipėda sea port gate) to 7,4 ‰ (in the southern part of the territorial sea) during summer expedition in the Baltic Sea. Water salinity increased with the depth reaching maximum (7,5 ‰) in the south west part of the observed area.

**Water transparency.** Water transparency varied from 1 m (at Klaipėda sea port gate) to 4 m in the western part of studied water area during seasonal summer expedition.

### Hydrochemical and hydrobiological observations

During the expedition collected samples were transported to the shore laboratory where the investigations were carried out. The results will be presented to the Environment integrated management information system (AIVIKS).
